The safety release valve is typically functioned in a closed position to protect it from bursting and over pressure. Isolation valves are the opposite of safety release valves and typically operate at 100 % open and have no controlling purpose. They open to let feed water or steam flow through, and the pressure loss is very low. In the case of an emergency, such as a heating pipe rupture in a steam generator, this valve is required to be closed.

The Isolation And Safety Valve market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
