Abstracts

Laser ablation is the process of irradiating a solid (or occasionally liquid) surface material with a laser beam. At low laser flux, the material is heated and evaporated or sublimated by the absorbed laser energy. At high laser flux, the material is typically converted to a plasma. Generally, laser ablation refers to the removal of material by pulsed laser, but if the laser intensity is sufficiently high, the material can be ablated with a continuous wave laser beam. Deep ultraviolet excimer lasers are mainly used for photoablation; lasers used for photoablation have wavelengths of about 200 nm.

The Laser Ablation Systems market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
