In biology and biochemistry, a lipid is a biomolecule that is soluble in nonpolar solvents. Non-polar solvents are typically hydrocarbons used to dissolve other naturally occurring hydrocarbon lipid molecules that do not (or do not easily) dissolve in water, including fatty acids, waxes, sterols, fat-soluble vitamins (such as vitamins A, D, E, and K), monoglycerides, diglycerides, triglycerides, and phospholipids. Lipid has a functional and significant role in the food because of its contribution to palatability, satiety, and nutrition. Consequently, quality of the lipid is a concern among consumers due to its association with numerous health problems. Lipid oxidation is a major problem in many areas of the food industry. Delaying lipid oxidation not only prolongs the shelf-life of a product, but also decreases raw material waste, nutritional loss, and widens the range of lipids that can be used in particular products.

The Lipids market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
