Female mosquito feeds on blood which helps it to acquire protein, which is important for the development of her eggs. Whenever mosquito bites, she releases saliva into the area where she is feeding. If a mosquito is harboring a pathogen, such as a virus, a protozoan, or a nematode worm, it is possible that she can transmit the pathogen to humans through her saliva. A mosquito can act as a vector for transfer of many pathogens responsible for the cause of various diseases such as malaria, dengue, etc. Malaria and dengue are responsible for the death of many people's across the globe. Thus, it is necessary to avoid mosquito bites; the best way to avoid mosquito bites is to avoid infested areas, wear protective clothing, and wear insect repellent. Mosquito repellent is a substance put on skin, clothing, or other surfaces which discourage mosquitoes from landing or crawling on that surface.
