Abstracts

Newcastle disease is a viral disease caused by avian paramyxovirus type 1 (APMV-1). The roots of this virus can be traced back to the genus Avulavirus, belonging to the Paramyxoviridae family. Newcastle disease virus (NDV) is a contagious bird disease, which affects various domestic birds such as chicken and turkey, among other birds. Chicken is found to be more susceptible to this disease. The viral strain can be classified into various phenotypes depending upon the virulence expression in chicken. These include the least virulent strains, moderately virulent strains, which are also called mesogenic strains, and the most virulent strains also known as velogenic strains. The disease is transmitted by the fecal-oral route, owing to the exposure to the infected birds' excretion, contaminated food, water, and equipment, among others. This disease is transmittable to humans.
The Newcastle Disease Vaccine market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
