Abstracts

Paraxylene, also known as PX or P-Xylene, is an aromatic hydrocarbon compound, derived particularly from benzene. Paraxylene is a colorless, toxic, sweet-smelling, and highly flammable chemical at room temperature. It is found naturally in petroleum and coal tar. Paraxylene or P-Xylene is an isomer of xylene compound, derived from benzene. Some of the other isomers of xylene include O-xylene and M-xylene. Paraxylene finds its largest application in large-scale manufacturing of terephthalic acid for polyester; also known as parylene. The production process of paraxylene is one of the most complicated among all the chemicals; simple crystallization of the xylene normally led to complex purification process owing to the formation of eutectic mixtures. It is manufactured by catalytic reforming of naphtha, a petroleum derivative, and separated in a series of adsorption or crystallization, distillation, and reaction processes from ethyl benzene, o-xylene, and m-xylene. The melting point of Paraxylene is highest among other isomers of xylene.

The Paraxylene (Px) market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
