Phenylketonuria is a rare genetic condition that leads to the production of phenylalanine in the body. Phenylalanine is an amino acid present in all proteins and in certain artificial sweeteners. The human body uses enzyme phenylalanine hydroxylase to convert phenylalanine into tyrosine, which is a nonessential amino acid. The human body requires tyrosine to create neurotransmitters, such as epinephrine, norepinephrine, and dopamine.

Phenylketonuria (PKU) is caused due a defect in the gene which helps to produce phenylalanine hydroxylase. Absence of phenylalanine hydroxylase leads to a buildup of phenylalanine in the body. Timely diagnosis and treatment helps in terminating the symptoms of PKU and avoid brain damage. Phenylketonuria is an inherited genetic condition caused due to a defect in the PAH gene. The PAH gene is responsible for the production of phenylalanine hydroxylase for breakdown of phenylalanine. Increased levels of phenylalanine can occur due to high intake of protein, such as eggs and meat. For an infant to inherit phenylketonuria, both parents must pass on a defective version of the PAH gene.

The Phenylketonuria (PKU) market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
