Abstracts

Plasma Nitriding known also as ion nitriding is a form of case hardening process. It is a heat treatment process which diffuses nitrogen into the surface of a metal to create a case-hardened surface.

Plasma nitriding uses plasma discharge physic to diffuse nitrogen into the surface of a ferrous alloy.

The plasma nitriding process starts by pumping the atmosphere of the furnace chamber until the desired vacuum pressure. Then a gas mixture typically made of nitrogen and hydrogen is introduced into the chamber. A voltage difference is applied between the wall of the furnace and the parts. Due to this difference of potential and to the low pressure the gas is ionized. Ion bombardment will have the double effect of cleaning the parts and also increase the temperature up to the nitriding temperature generally between 500 and 580°C.

The Plasma Nitriding Furnace market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
