Abstracts

Neurostimulation, which was developed decades ago primarily for treating spinal cord injuries, has expanded over the years to alleviate or control various medical conditions, including epilepsy, chronic pain, bladder or fecal incontinence, Parkinson's disease, essential tremor, and anxiety, to name a few. Neurostimulation, also known as neuromodulation, works by stimulating parts of the nervous system (e.g., sacral or vagus nerve, deep-brain, spinal cord, and other areas) with a regulated or intermittent electrical pulse. This low-level energy acts to regulate, block, or stimulate nerve signals between the brain and the part of the body that is affected, depending on the type of therapy required. To ensure these implantable devices are properly shielded from the harsh environment of the human body – as well as to protect the patient from any issues the device could cause, neurostimulation devices need protection.

The Protecting Implantable Neurostimulation Devices market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
