Abstracts

Refinery process additives are chemicals that are used to improve the fuel performance by meeting the fuel specification enacted by government authorities. Each refinery has its own set of requirements. These are governed by the regulatory specifications of the geographical area for which the oil products are intended, the origin of the crude oil for processing, and their particular refining scheme. All refineries faces the same challenge: increase production to make it as competitive as possible. Refining additives are used to achieve this particular goal. Refinery process additives are added during the refining process. They can also be used to convalesce the performance of particular end-product specification such as diesel or gasoline. Refinery process additives can be used or added in various refinery processes such as distillation process, reformer system, cracker, coker, filling plant process, catalytic reforming, desulfurization, and vacuum distillation.

The Refinery Process Additives market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
