Software-defined security (SDS) is a type of security model in which the information security in a computing environment is implemented, controlled and managed by security software.

Software Defined Security (SDS) is a security model in which information security in a computing environment is implemented, controlled, and managed by security software. Software-defined security is typically implemented in IT environments with minimal or no hardware-based security dependencies, such as cloud computing and virtualized infrastructure. Under the basic security policy, each new device created in the environment is automatically overwritten and controlled. This also ensures that the security scope and scalability of the underlying environment changes as the infrastructure/environment resources increase. In addition, as software-defined and managed security, environments can be moved or migrated within other data centers/IT facilities without impacting existing security policies and controls.

The Software-Defined Security market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
