SiP is a kind of package concept, which is a package method in which all or most of the electronic functions of a system or subsystem are arranged in an integrated substrate, and the chip is bonded to the integrated substrate in a 2D or 3D manner. The SIP package does not have a certain type. In terms of the arrangement of the chips, the SIP can be a planar 2D package of a multi-chip module, and the structure of the 3D package can be reused to effectively reduce the package area; and the internal bonding technology can be For simple wire bonding, flip chip bonding can also be used, but it can also be used in combination. In addition to the 2D and 3D package structure, another way to integrate components with versatile substrates can also be included in the scope of SIP. This technology is mainly to embed different components in the multi-function substrate, and can also be regarded as the concept of SIP to achieve the purpose of functional integration. Different chip arrangements, combined with different internal bonding technologies, enable a variety of combinations of SIP package types, and can be customized or flexibly produced according to customer or product requirements.
