The photomask consists of a fused silica (QZ) or glass (SL) substrate coated with an opaque film in which an exact copy of the device designer pattern is etched. The photomask has a function similar to that used in photography. Just like printing the same picture from film, the photomask can reproduce thousands of circuits and patterns. Photolithography techniques are used in photomask fabrication processes to create chrome patterns on quartz substrates. The completed photomask is then used as a photographic plate for an LSI, LCD, PCB, or the like.

The Tft-LCD Photomask market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
