Abstracts

Tissue-engineered skin substitutes have become viable as a suitable alternative to auto- and allografts. Chronic wounds and extensive skin loss have become serious problem globally. Even if injured epidermis is normally able to self-renew, deep injuries can cause negative regulation of the wound healing cascade, leading to chronic wound formation. Skin-autografting surgical procedures are often limited by the poor availability of healthy tissue, whereas the use of non-self-tissues for allografts presents some severe risks.
