Abstracts

A machine tool used in the mass production of a unique product or a family of similar products by processing the drilling, boring, milling, and other machining operations in a given order on each part machined.

Transfer machines are metal working machine tools with several stations for performing various machining processes. Workpieces are fed into the machine and automatically indexed from station to station. Each station simultaneously performs a different operation on the workpiece and they exit the machine as a partially or completely finished unit. Standard transfer machine systems consist of multiple, sequential mechanical components, such as machining heads, transfer devices, indexing tables, and work. Workpieces are held by stationary or traveling fixtures and indexed in a circular or linear path. In the course of a cycle, components pass through each work station undergoing specific machining operations. The indexing table turns either vertically or horizontally and supports both continuous and intermittent movement. When combined with an automated transfer line for part feeding, transfer machines amplify production rate.

The Transfer Machine market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
