Abstracts

In general, the refrigeration principle of the refrigerator is to compress the lower pressure steam into a higher pressure steam, so that the volume of the steam is reduced and the pressure is increased. The compressor draws in the lower pressure working fluid vapor from the evaporator, raises the pressure and sends it to the condenser, and condenses it into a higher pressure liquid in the condenser. After the throttling valve is throttled, the pressure becomes higher. After the low liquid is sent to the evaporator, it absorbs heat in the evaporator and evaporates to become a lower pressure steam, which is then sent to the inlet of the compressor to complete the refrigeration cycle.

The Truck Refrigeration market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
