## **Abstracts**

Weather radar is founded on basic Doppler radar principles, in which a transmitter emits short pulses of energy at a specific wavelength. These energy waves scatter upon contact with airborne particles, directing some energy back to the radar system. Computers associated with the system analyze key data about the signals—their strength, travel time, and frequency shift, for example—to determine the type and intensity of precipitation. Weather radar systems typically transmit radiation via a magnetron or klystron tube connected to a parabolic antenna.

The Weather Radar Systems market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
