Abstracts

Wire enamels are applied on copper and aluminum wires for primary insulation to avoid a short-circuit of the windings and thus a motor failure.

Wire enamels are applied on copper and aluminum round and flat wires used in motors, transformers, generators and electrical measuring instruments. They are cured onto the wires with heat. The resulting coating's main function is electrical insulation. Wire enamels are also described as primary insulation. The coated wires are sometimes called "magnet wires". Wire enamels are applied to copper and aluminum wires in up to 30 layers. This provides electrical insulation and helps the windings from short-circuiting. These wire enamels must also have very good chemical and thermal resistance, must adhere very well to copper or aluminum wire, and have outstanding mechanical stability.

The Wire Enamels market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
