Abstracts

X-ray inspection systems are used to detect defects in materials by non-destructive methods. The primary goals of x-ray inspection systems are anomaly such as rubber, glass shards, metal, high density plastics, stone, or even bone fragments detection and overall working process optimization. X-ray inspection systems are primarily used in applications such as shape analysis, missing items, package integrity, and contaminant detection. In an x-ray inspection, image of an object that needs to be inspected, is produced using x-rays and processed through an image processing software to detect specific anomalies. X-rays used to produce an image are of very high energy; therefore, are able to penetrate solid bodies. While passing through the product, x-rays are attenuated to a lower or higher density as per density of the inspected object. The detector in x-ray inspection systems then converts the attenuated x-rays into an electrical signal. Higher the density of an object, darker the x-ray image. Image processing software detects and highlights the contaminants by observing the contrast differences in the images produced by x-rays.

The X-Ray Inspection Systems market revenue was xx.xx Million USD in 2019, and will reach xx.xx Million USD in 2025, with a CAGR of x.x% during 2020-2025.
