Abstracts

A full body scanner is a special device used toexpose objects, including weaponries and explosives that could be hidden under clothing on a person's body. Full body scanners are generally used for security purposes. They work without making any sort of physical contact and without having to have clothes removed from human bodies. Full body scanners work on two distinct technologies - millimeter wave technology and backscatter X-ray technology. Depending on the type of technology being used, an operator can check a person'sbody through an alternate-wavelength image of the person's naked body or through a cartoon-like picture of the person with an indicator screening the section where any doubtful items can be detected.
