Abstracts

3D printing or additive manufacturing is a process of making three dimensional solid objects from a digital file. The creation of a 3D printed object is achieved using additive processes. In an additive process, an object is created by laying down successive layers of material until the object is created. 3D printing enables companies to produce complex (functional) shapes using less material than traditional manufacturing methods. For electronics manufacturers, 3D printing technology holds considerable potential, as speeding time to market can help the industry keep pace with ever-shortening product life cycles for electronics consumers, the ease with which the technology can be used to generate varied product designs holds great potential for creating customized forms and features.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the 3D Printed Electronics market covering all its essential aspects.
