Abstracts

3D Printing Ceramics is the product produced by the 3D printer. The print head of the 3D printer is lowered and immersed in the suspension. UV light activates polymerization so that the material hardens at the coordinates specified by a CAD file. This creates the desired shape layer by layer. The object receives its final properties in a subsequent multi-level treatment: In the thermal debonding process, the plastic components, which are only required as aids for the construction of the green body, are removed from the green body at temperatures of up to 1600°C. The workpiece receives the hardness and smooth surface typical of ceramics in a final sintering process.

The 3D Printing Ceramics market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
