Abstracts

3D Printing Ceramics is the product produced by the 3D printer.The print head of the 3D printer is lowered and immersed in the suspension. UV light activates polymerization so that the material hardens at the coordinates specified by a CAD file. This creates the desired shape layer by layer.The object receives its final properties in a subsequent multi-level treatment: In the thermal debonding process, the plastic components, which are only required as aids for the construction of the green body, are removed from the green body at temperatures of up to 1600°C. The workpiece receives the hardness and smooth surface typical of ceramics in a final sintering process.

Based on the 3D Printing Ceramics market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail.
