## Abstracts

An interposer, a silicon substrate made of silicon and organic materials, is the conduit through which electrical signals pass through multichip modules in advanced packaging. The intermediary layer is added between the substrate and the Die, which plays a role as a link between the previous and the next. With the help of the silicon intermediary channels extending in all directions, multiple Dies can be freely combined together, just like a giant underground transportation hub. The principle of a 3D Silicon Interposer is to make a transistor (CMOS) structure on the chip, and directly use TSV to connect the electronic signals of different chips up and down, so as to directly stack memory or other chips vertically on it.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the 3D Silicon Interposer market covering all its essential aspects.
