Abstracts

The 5G Baseband Chip is a chip in smart phones, tablet computers or other devices, which helps to convert digital data into radio frequency signals (and vice versa) and then transmit them through wireless access networks. In the 5G technology architecture, the baseband chip is used to synthesize the baseband signal to be transmitted or decode the received baseband signal. Specifically, when transmitting, audio signals are compiled into baseband codes for transmission. When receiving, the received baseband code is interpreted as an audio signal. At the same time, it is also responsible for compiling address information (mobile phone number, website address), text information (website text, short message text) and picture information. Baseband chip, as the core support of 5G technology, realizes the whole process from encoding and decoding to receiving and decoding.
