## Abstracts

Activated carbon fiber is an activated carbon-containing fiber. A certain carbon-containing fiber (such as phenolic-based fiber, PAN-based fiber, viscose-based fiber, pitch-based fiber, etc.) is activated at high temperatures to generate nano-scale pore size on its surface and increase specific surface area, thereby changing its physicochemical properties. The fiber diameter of activated carbon fiber is 5~20 $\mu$ m, the average specific surface area is about 1000~1500m<sup>2</sup>/g, the average pore size is 1.0~4.0nm, and the micropores are evenly distributed on the fiber surface. Activated carbon fiber has good adsorption capacity and faster adsorption kinetic performance. It has high adsorption efficiency for organic matter, anion, and cation in the liquid and gas phase, fast adsorption and desorption, and can be regenerated and recycled. At the same time, it is resistant to acid and alkali. High-temperature resistance, strong adaptability, good electrical conductivity, and chemical stability, is an ideal environmental protection material.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Activated Carbon Fiber (ACF) market covering all its essential aspects.
