## Abstracts

The sensor is mainly responsible for data acquisition and information transmission. Through various network access, the ubiquitous connection between things and people, as well as the intelligent perception, identification and management of goods and processes can be realized. Agricultural sensors can sense environmental variables such as water, heat and light, and can also sense biological ontology, such as plant health. In the construction of the agricultural Internet of Things, a large number of sensor nodes form a monitoring network with different functions to timely understand environmental changes and ensure the optimal level of plant growth and crop quality. By collecting information from various sensors, agricultural managers can find problems in time and provide relevant intelligent decisions.
