## Abstracts

Agricultural pumps have two major components, namely impellers and diffusers. Fluid entering inside the impeller, along the rotating axis, flows radially outward through the diffuser, toward the discharge pipe. Agricultural pumps, in a broader sense, can be segmented into centrifugal and positive displacement pumps. Positive displacement pumps work on a principle, which involves trapping a specific quantity of fluid at the inlet and forcing the fluid to move to the discharge pipe. A centrifugal pump relies on the conversion of rotating kinetic energy into hydrodynamic energy to pump fluid.

Submersible pumps remain entirely submerged inside the liquid required to be pumped and are a type of centrifugal pumps. These pumps require relatively low energy to push the liquid toward the surface and ensure prevention of cavitation.

Based on the Agriculture Pumps market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
