## Abstracts

Air bearings are of two types, namely, aerodynamical or aerostatical bearings. Air bearings use thin film of air which is pressurised in order to obtain an interface between the surfaces which has very less friction and is load bearing and these two surfaces do not come in physical contact with each other. This pressurised air is the lubricating factor in air bearings. Due to absence of contact between the two surfaces, the problems of friction, lubricant handling, heat, wear and tear etc., are avoided. The air bearing is designed in such a way that the pressure generated between the face of the surfaces supports the load, even if there is constant air escape from the gap.

The Air Bearings market revenue was xx Million USD in 2016, grew to xx Million USD in 2020, and will reach xx Million USD in 2026, with a CAGR of xx during 2020-2026.
