Abstracts

Air bearings are of two types, namely, aerodynamical or aerostatical bearings. Air bearings use thin film of air which is pressurised in order to obtain an interface between the surfaces which has very less friction and is load bearing and these two surfaces do not come in physical contact with each other. This pressurised air is the lubricating factor in air bearings. Due to absence of contact between the two surfaces, the problems of friction, lubricant handling, heat, wear and tear etc., are avoided. The air bearing is designed in such a way that the pressure generated between the face of the surfaces supports the load, even if there is constant air escape from the gap. Based on the Air Bearings market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
