Abstracts

An auxiliary power unit (APU) is a device on an aircraft that is used for various purposes other than the thrust for the engine. The main function of the aircraft APU is to provide power to start the main engine of the aircraft. The turbine engine must be propelled to high speeds in the aircraft to provide the necessary air compression to maintain the required efficiency of the engine. Smaller jet engines are typically given initial propulsion by an electric motor, while larger engines are typically propelled by an air turbine motor.
