Abstracts

An auxiliary power unit (APU) is a device on an aircraft that is used for various purposes other than the thrust for the engine. The main function of the aircraft APU is to provide power to start the main engine of the aircraft. The turbine engine must be propelled to high speeds in the aircraft to provide the necessary air compression to maintain the required efficiency of the engine. Smaller jet engines are typically given initial propulsion by an electric motor, while larger engines are typically propelled by an air turbine motor. Based on the Aircraft APU market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
