Abstracts

Alkylation is the transfer of an alkyl group from one molecule to another. The alkyl group may be transferred as an alkyl carbocation, a free radical, a carbanion or a carbene (or their equivalents). An alkyl group is a piece of a molecule with the general formula C_nH_{2n+1} , where n is the integer depicting the number of carbons linked together. For example, a methyl group ($n = 1$, CH_3) is a fragment of a methane molecule (CH_4). Alkylating agents utilize selective alkylation by adding the desired aliphatic carbon chain to the previously chosen starting molecule. This is one of many known chemical syntheses. Alkyl groups can also be removed in a process known as dealkylation. Alkylating agents are often classified according to their nucleophilic or electrophilic character.

In oil refining contexts, alkylation refers to a particular alkylation of isobutane with olefins. For upgrading of petroleum, alkylation produces a premium blending stock for gasoline.

2,2,4-Trimethylpentane, also known as isooctane or iso-octane, is an organic compound with the formula $(CH_3)_3CCH_2CH(CH_3)_2$. It is one of several isomers of octane (C_8H_{18}). This particular isomer is the standard 100 point on the octane rating scale (the zero point is *n*-heptane). It is an important component of gasoline, frequently used in relatively large proportions to increase the knock resistance of the fuel.

Based on the Alkylate and Isooctane market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
