Abstracts

Alpha-olefin refers to a single olefin with double bond at the end of the molecular chain, the molecular formula is $R-CH=CH_2$, where R is an alkyl group. If R is a straight-chain alkyl group, it is called a straight-chain alpha-olefin (LAO). Alpha-olefins as industrial products have a wide distribution of carbon numbers (C4-C40). Alpha-olefins have different applications according to their carbon chain lengths, and linear alpha-olefins with carbon numbers ranging from C6 to C18 (or C20) are widely used. Among them, the most widely used varieties are components such as C4, C6 and C8. For example, 1-butene, 1-hexene and 1-octene can be used to produce high density polyethylene (HDPE) and linear low density polyethylene (LLDPE) comonomers to improve their tear and stretch resistance strength.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Alpha-olefins market covering all its essential aspects.
