## Abstracts

Ampicillin, a semi-synthetic derivative of penicillin, causes cell death by interfering directly with bacterial cell wall synthesis and indirectly by initiating the release of enzymes that further aids in altering the cell wall. Presence of an amino group is the only difference between ampicillin and penicillin. An amino group in ampicillin aids penetration through the outer membrane of gram-positive and certain gram-negative bacteria. Ampicillin finds use as an antibiotic in preventing and treating a number of bacterial infections such as respiratory tract infections, meningitis, salmonella infections, urinary tract infections, and endocarditis. Ampicillin is also used in the treatment of group B streptococcal infection in newborns. Ampicillin was the first 'broad spectrum' type of penicillin having activity against gram-positive bacteria.

Based on the Ampicillin market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
