## Abstracts

Animal model is a living, non-human animal used during the research and investigation of human disease, for the purpose of better understanding the disease without the added risk of harming an actual human being during the process. Animal models serving in research may have an existing, inbred or induced disease or injury that is similar to a human condition. The animal chosen usually meets a determined taxonomic equivalency to humans, so as to react to disease or its treatment in a way that resembles human physiology as needed. The use of animal models allows researchers to investigate disease states in ways which would be inaccessible in a human patient, performing procedures on the non-human animal that imply a level of harm that would not be considered ethical to inflict on a human.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Animal Model Services market covering all its essential aspects.
