## Abstracts

Antifreeze proteins (AFPs) are synthesized by various organisms to enable their cells to survive subzero environments. AFPs exert their effects by lowering the freezing point of water as well as preventing the growth of ice crystals and recrystallization during frozen storage. Their ability to modify the growth of ice results in the stabilization of ice crystals over a defined temperature range and in the inhibition of the recrystallization of ice, which could reduce drip loss during thawing, improve the quality and extend the shelf life of frozen food.
