Abstracts

Aroma chemicals, also known as fragrances and odorants are chemical compounds which consist of odor or smell. These compounds are volatile enough to travel through the olfactory system of the nose and cause odor. Unlike flavors which affect smell and taste, fragrances affect only smell. The nature of fragrances tends to be synthetic. Aroma chemicals can be found in food, wine, spices, essential oils, perfumes and fragrance oils. Most of the aroma chemicals are formed biochemically during the ripening process of fruits and crops. These compounds have a considerable role in the manufacture of flavorants which are used in food preparation to improve flavor. On the basis of structural composition, aroma chemicals can be classified into esters, amines, linear terpenes, cyclic terpenes, and aromatic. Aroma chemicals are widely added in odorizers to give a distinct smell to odorless gases, such as propane, hydrogen and natural gas, as a warning.

Based on the Aroma Chemicals market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
