Abstracts

Asbestos is a naturally occurring mineral composed of thin, tightly packed fibers. Due to its strength, asbestos used to be commonly used in the manufacturing of insulation, fireproofing, and other construction materials. Unfortunately, asbestos has been found to pose a serious health risk when its fibers become loose and airborne, since breathing them in can cause scarring of the tissue lining the lungs mesothelioma and even lung cancer. You can check for signs of asbestos on your own, but testing should be done by a certified professional using special equipment. If asbestos is present, hire a contractor to repair or remove the materials that contain it to ensure the safety of people using the building.
