Abstracts

The combustion of coal in coal-fired boilers produces unburned residues. These residues include bottom ash, also known as clinker ash, which exists at the bottom of the boiler. Bottom ash generally accounts for less than the quarter of the total ash production. This ash must be collected and disposed of owing to adverse environmental and health concerns. Despite its use in cement and other building material manufacturing, large quantities must still be disposed of in landfills, waste sites or impoundments. Intermittent removal of bottom ash collected at the bottom of the furnace is carried out using bottom ash handling systems.
