Abstracts

Atherectomy is a procedure used to clean out clogged heart arteries. An atherectomy catheter has a hollow cylinder on the tip with an open window on one side and a balloon on the other. When the catheter is inserted into the narrowed artery, the balloon is inflated, pushing the window against the fatty matter clogging the vessel. A blade (cutter) within the cylinder rotates and shaves off any fat that protrudes into the window. The shavings are caught in a chamber within the catheter and removed. This process is repeated as needed to allow better blood flow.

Based on the Atherectomy Devices market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
