Abstracts

Audiophile headphones are high-fidelity headphones customized only with the highest quality components. These are truly luxurious audio equipment that can reproduce sound signals with the highest possible accuracy. These earmuffs have a closed or open design. Audiophile headsets firmly emphasize sound quality and are an ode to great sound rather than sensors or streaming technology.

Headphone amplifier is abbreviated as headphone Amps, which is a kind of amplifier, which is an audio amplifier specially designed to drive headphones. Headphone amplifiers generally appear in the form of integrated circuits in electronic equipment, music players and TVs, and there are also independent headphone amplifiers.

A DAC [Digital-to-Analog Converter] is a device that converts digital audio information (comprised of a series of 0s and 1s) into an analog audio signal that can be sent to a headphone amp. The most popular DAC connection method is via USB from a computer. There are also digital feeds available from Optical and Coaxial outputs -- also known as SPDIF connections -- found on CD/DVD players and other audio gadgets that can connect into a DAC. Modern smartphones can even be hooked into outboard amp/DACs, typically by using sundry interconnect cables and adapters. In most cases, you can not connect a headphone directly into a DAC. Thus, a headphone amp must serve as the intermediary step between a DAC and your headphones.
