Abstracts

There are two main types of auto glass — tempered glass and laminated safety glass. Tempered glass, which typically is used on the rear and side windows, goes through a special process where it is heated and then quickly cooled. Laminated safety glass, which is typically used on windshields, is composed of two pieces of glass with a thin layer of vinyl. It's then heated and pressed together in an oven called an autoclave. Both types of glass are stronger and more impact resistant than regular glass. When tempered glass receives a strong hit, it will shatter, but it will shatter and fall to the ground into small pieces that do not have sharp edges like regular glass. When laminated safety glass receives a strong impact it will also shatter but, generally, the pieces will adhere to the vinyl and not fall to the ground.

Based on the Auto Glass market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.
