Abstracts

Automotive Collision Repair is a complex process. The parts manager will order all the parts needed for the repair. Once parts arrive the vehicle can then be scheduled for repairs. The vehicle is in the shop and is ready to be disassembled. Once parts have been removed, a secondary inspection will determine if there is any damage that couldn't be detected initially. If more damage is found, a supplemental report will be completed and sent to the insurance company. Once approved, any additional parts will be ordered and an updated completion date will be given. If necessary, the vehicle will be placed on a unibody repair equipment. New panels will be prepared and installed. Priming, sealing, and corrosion protection is added to the new parts. All work is inspected and tested. Once the repairs are signed off, the vehicle will head to the paint department. First, the vehicle will be pressure washed and chemically cleaned. Next, it is prepped, primed, sanded and sealed. The last stage before entering the paint booth is taping and masking around the area(s) to be painted, which will protect the parts of the vehicle that will not need painting. Any dust particles will be removed so as not to interfere with the paint process. The vehicle is now ready to undergo multi-step refinishing using an acrylic urethane paint system. Parts that were removed for painting are reassembled, the vehicle is realigned, and climate control is checked for proper operation. The vehicle is then detailed and any extras (such as pinstripes) are taken care of.
