## **Abstracts**

The fuel cell is a device which is converting the chemical energy from a fuel into electricity with a chemical reaction. The fuel cells involve a continuous source of fuel and oxygen to sustain the chemical reaction and can yield electricity for as long as these inputs are supplied. Every fuel cell is made up of three parts such as an anode, an electrolyte, and a cathode. The increasing number of advancements and need of fuel cells is reducing a dependency on foreign countries for oil, environmental concerns, rising oil prices, and also proves to be a good competitor for electric vehicles which faces the problems of bulky and very costly batteries.

Based on the Automotive Fuel Cells market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
