Abstracts

A system of several mechanisms working together, the power steering pump converts energy produced by a car's engine into hydraulic power, which it uses to add the torque to the movements of the steering wheel. It starts with a drive belt connected to the engine, which spins a rotary within the power steering pump. This movement pulls power steering fluid through it, injecting it back into the system under high pressure. That hydraulic pressure translates into force applied to the rack and pinion steering column. When the steering wheel is at rest, the pressure remains even on either side of the column. When the wheel turns to one side or another, it raises the hydraulic pressure on one side of the column to turn in that direction. Thus, with only a slight nudge of a steering wheel, you get the necessary muscle to change the direction of that heavy machine you call a car.
