## **Abstracts**

A software-defined radio is a wireless communication device in which the transmitter and receiver functions are changed or changed using software without any changes to the hardware. These radios eliminate the need to use capacitors and resistors because software-based algorithms are used to select specific necessary frequencies. An autonomous software-defined radio receiver is an software-defined radio receiver that can be configured autonomously for any type of signal arriving at the antenna.

Based on the Autonomous Software-Defined Radio Receiver market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.
