Abstracts

An AUG is a type of AUV that uses minute changes in its buoyancy to move upward and downward in the ocean akin to a profiling float. However, unlike a float, the AUG uses its wings to convert vertical motion into horizontal motion, thus driving itself forward with very low power consumption. It is not fast when compared to a conventional AUV. However, AUGs that employ buoyancy-based propulsion characterize a substantial increase in duration and range, and can extend ocean surveying missions to thousands of kilometers of range, and from hours to weeks or months.

Based on the Autonomous Underwater Glider market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields.
