# **Abstracts**

Aviation fuel is a specialized type of petroleum-fuel used to power aircraft. It is generally of higher quality than fuels used in less critical applications, such as heating or road transportation, and often contains additives to reduce the risk of icing or explosion due to high temperature among other properties.

Most current commercial airlines and military aircraft use jet fuel for maximum fuel efficiency and lowest cost. Aviation fuel generally arrives at the airport via pipeline systems, such as the CEPS (Central Europe Pipeline System) in Europe. It is then pumped over and dispensed from a tanker. The fuel is then driven up to parked aircrafts and helicopters. Some airports have pumps similar to filling stations to which aircraft must taxi. Some airports have permanent piping to parking areas for large aircrafts.

The report combines extensive quantitative analysis and exhaustive qualitative analysis, ranges from a macro overview of the total market size, industry chain, and market dynamics to micro details of segment markets by type, application and region, and, as a result, provides a holistic view of, as well as a deep insight into the Aviation Fuel market covering all its essential aspects.

For the competitive landscape, the report also introduces players in the industry from the perspective of the market share, concentration ratio, etc., and describes the leading companies in detail, with which the readers can get a better idea of their competitors and acquire an in-depth understanding of the competitive situation.
