## Abstracts

Aviation fuel is a specialized type of petroleum-fuel used to power aircraft. It is generally of higher quality than fuels used in less critical applications, such as heating or road transportation, and often contains additives to reduce the risk of icing or explosion due to high temperature among other properties.

Most current commercial airlines and military aircraft use jet fuel for maximum fuel efficiency and lowest cost. Aviation fuel generally arrives at the airport via pipeline systems, such as the CEPS (Central Europe Pipeline System) in Europe. It is then pumped over and dispensed from a tanker. The fuel is then driven up to parked aircrafts and helicopters. Some airports have pumps similar to filling stations to which aircraft must taxi. Some airports have permanent piping to parking areas for large aircrafts. Based on the Aviation Fuel market development status, competitive landscape and development model in different regions of the world, this report is dedicated to providing niche markets, potential risks and comprehensive competitive strategy analysis in different fields. From the competitive advantages of different types of products and services, the development opportunities and consumption characteristics and structure analysis of the downstream application fields are all analyzed in detail. To Boost Growth during the epidemic era, this report analyzes in detail for the potential risks and opportunities which can be focused on.

In Chapter 2.4 of the report, we share our perspectives for the impact of COVID-19 from the long and short term.

In chapter 3.4, we provide the influence of the crisis on the industry chain, especially for marketing channels.
